

People Counter CP-DELTA 16

CP- DELTA 16 is an electronic system designed for shopping centres and for all those places where people gather.

It allows to monitor with precision visitor flow by entrance or exit: it is ideal for libraries, museums, cultural events.

CP-DELTA 16 is based on the principle of a double infra-red beam interruption, it can be connected to a PC and by its proper "GFV" software it provides immediate analysis and comparisons of visitors flow. It is therefore possible to verify presence modifications in real time and intervene opportunely (for example: to open cash -desks, overcrowding...).

You can have daily, weekly, monthly or annual averages, statistics and personalised reports. The "GFV" program has a key for software protection from unauthorised reproduction.

CP-DELTA 16 is a cabled system but its installation is extremely simple. The elegant small columns do not require particular attention in the beams alignment and are independent: a simple telephone cable and an interface allow the connection with a PC.

There is also a server version for a remote archives consultation of the connected computers.
